Section 1 : Coding

1. Problem Statement

Camila, a user of a social media platform, is looking to change her password to enhance account security. The platform enforces specific rules for password strength to ensure the safety of user accounts. Camila needs a program that prompts her to enter a new password and throws custom exceptions based on the strength of the password.

Password Strength Criteria:

Weak Password:

Length less than 8 characters.Medium Password:

Length 8 or more characters.Missing a mix of uppercase letters, lowercase letters, and digits.

Implement a custom exception, to assist Camila in changing her password

securely. The program should interactively take user input for a new password, categorize its strength, and handle custom exceptions (WeakPasswordException and MediumPasswordException) if the password fails to meet the specified criteria.

Input Format

The input consists of a string s, representing the new password.

Output Format

The output is displayed in the following format:

If the entered password meets the strength criteria, the program outputs

"Password changed successfully!"

If the entered password is weak, the program outputs

"Error: Weak password. It must be at least 8 characters long."

If the entered password is of medium strength, the program outputs

"Error: Medium password. It must include a mix of uppercase letters, lowercase letters, and digits."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: ComplexP@ss1
Output: Password changed successfully!

Answer

```
import java.util.Scanner;

class WeakPasswordException extends Exception {
    public WeakPasswordException(String message) {
        super(message);
    }
}
```

```
class MediumPasswordException extends Exception {
    public MediumPasswordException(String message) {
        super(message);
    }
}

public class Main {
    public static void checkPasswordStrength(String password) throws
WeakPasswordException, MediumPasswordException {
        if (password.length() < 8) {
            throw new WeakPasswordException("Error: Weak password. It must be at
least 8 characters long.");
        }

        boolean hasUpper = false;
        boolean hasLower = false;
        boolean hasDigit = false;

        for (char ch : password.toCharArray()) {
            if (Character.isUpperCase(ch)) hasUpper = true;
            else if (Character.isLowerCase(ch)) hasLower = true;
            else if (Character.isDigit(ch)) hasDigit = true;
        }

        if (!(hasUpper && hasLower && hasDigit)) {
            throw new MediumPasswordException("Error: Medium password. It must
include a mix of uppercase letters, lowercase letters, and digits.");
        }

        System.out.println("Password changed successfully!");
    }

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String newPassword = scanner.nextLine();
        try {
            checkPasswordStrength(newPassword);
        } catch (WeakPasswordException | MediumPasswordException e) {
            System.out.println(e.getMessage());
        }
        scanner.close();
```

```
    }
}
```

Status : Correct ***Marks : 10/10***

2. Problem Statement

A company is developing a user registration system that requires users to provide valid email addresses. The development team is implementing an EmailValidator program to ensure that the entered email addresses meet certain criteria using exception handling.

The email address must contain the "@" symbol.The email address must consist of a non-empty username(before "@" symbol) and a non-empty domain(after "'@" symbol).The domain part of the email address must contain at least one period (".").The email address must not contain leading or trailing spaces.

Implement a custom exception, InvalidEmailException, to fulfill the company's requirements and validate it according to the specified rules.

Input Format

The input consists of a string value 's', which represents the email address.

Output Format

The output is displayed in the following format:

If the entered email address is valid according to the specified rules, the program prints:

"Email address is valid!"

If the entered email address misses the username or domain part or misses "@" symbol or has two or more "@" symbols or misses '.' in the domain part it outputs:

"Error: Invalid email format."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: johndoe@example.com
Output: Email address is valid!

Answer

```
import java.util.Scanner;

class InvalidEmailException extends Exception {
    public InvalidEmailException(String message) {
        super(message);
    }
}

public class Main {
    public static void validateEmail(String email) throws InvalidEmailException {
        if (!email.equals(email.trim())) {
            throw new InvalidEmailException("Error: Invalid email format.");
        }

        int atCount = 0;
        for (char ch : email.toCharArray()) {
            if (ch == '@') atCount++;
        }
        if (atCount != 1) {
            throw new InvalidEmailException("Error: Invalid email format.");
        }

        int atIndex = email.indexOf('@');
        String username = email.substring(0, atIndex);
        String domain = email.substring(atIndex + 1);

        if (username.isEmpty() || domain.isEmpty()) {
            throw new InvalidEmailException("Error: Invalid email format.");
        }

        if (!domain.contains(".")) {
            throw new InvalidEmailException("Error: Invalid email format.");
        }
```

```
        System.out.println("Email address is valid!");
    }

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String email = scanner.nextLine();

        try {
            validateEmail(email);
        } catch (InvalidEmailException e) {
            System.out.println(e.getMessage());
        }

        scanner.close();
    }
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Faustus is managing his bank account and wants to create a program to update his account balance based on certain conditions. However, he needs to handle specific scenarios related to invalid inputs and insufficient balances. Faustus wants to update his account balance. He inputs the current balance and the amount to be updated.

The initial account balance should be positive. If Faustus enters a negative initial balance, the program should throw an InvalidAmountException with the message "Invalid amount. Please enter a positive initial balance."If the amount to be updated is negative, the program should check if the subtraction results in a negative balance. If so, it should throw an InsufficientBalanceException with the message "Insufficient balance."If the amount to be updated is positive, it should be added to the current balance, and the new balance should be printed.

Implement a custom exception, InvalidAmountException, and InsufficientBalanceException, to manage his bank account.

Input Format

The first line of input consists of a double value 'd', representing the initial account balance.

The second line of input consists of a double value 'd1', representing the amount to be updated.

Output Format

The output is displayed in the following format:

If the validation passes, print

"Account balance updated successfully! New balance: {new_balance}"

where {new_balance} is the updated account balance.

If the initial bank amount is negative it displays

"Error: Invalid amount. Please enter a positive initial balance."

If the updated amount exceeds the initial account balance in withdrawal it displays

"Error: Insufficient balance."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1000
500
Output: Account balance updated successfully! New balance: 1500.0

Answer

```
import java.util.Scanner;

class InvalidAmountException extends Exception {
    public InvalidAmountException(String message) {
        super(message);
    }
}
```

```
class InsufficientBalanceException extends Exception {
    public InsufficientBalanceException(String message) {
        super(message);
    }
}

public class Main {

    public static double updateBalance(double initialBalance, double
amountToUpdate)
            throws InvalidAmountException, InsufficientBalanceException {

        if (initialBalance < 0) {
            throw new InvalidAmountException("Error: Invalid amount. Please enter a
positive initial balance.");
        }

        if (amountToUpdate < 0) {
            if (initialBalance + amountToUpdate < 0) {
                throw new InsufficientBalanceException("Error: Insufficient balance.");
            } else {
                return initialBalance + amountToUpdate;
            }
        } else {
            return initialBalance + amountToUpdate;
        }
    }

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double initialBalance = scanner.nextDouble();
        double amountToUpdate = scanner.nextDouble();

        try {
            double newBalance = updateBalance(initialBalance, amountToUpdate);
            System.out.printf("Account balance updated successfully! New balance:
%.1f\n", newBalance);
        } catch (InvalidAmountException | InsufficientBalanceException e) {
            System.out.println(e.getMessage());
        }
```

```
        scanner.close();
    }
}
```

Status : Correct **Marks : 10/10**

4. Problem Statement

Theo is trying to update his payment information on a subscription-based streaming service. To proceed, the system requires Theo to provide a valid credit card number consisting of 16 digits. However, Theo wants to make sure that the credit card number he enters meets the specified criteria with proper exception handling.

The credit card number must consist of exactly 16 digits.If the entered credit card number does not meet the specified criteria, the program should throw a custom exception, InvalidCreditCardException, and provide Theo with specific error messages:If the length of the credit card number is not 16 digits, the exception message should be: "Invalid credit card number length."If the credit card number contains non-numeric characters, the exception message should be: "Invalid credit card number format."

Implement a custom exception, InvalidCreditCardException, to fulfill Theo's requirements and keep his payment information secure.

Input Format

The input consists of a string value 's', consisting of the 16-digit credit card number.

Output Format

The output is displayed in the following format:

If the entered credit card number is valid, the program should output a success message:

"Payment information updated successfully!"

If the entered credit card has more than 16 digits or less than 16 digits it displays

"Error: Invalid credit card number length."

If the entered 16-digit credit card has non-integers it displays

"Error: Invalid credit card number format."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1234567890123456
Output: Payment information updated successfully!

Answer

```
import java.util.Scanner;

class InvalidCreditCardException extends Exception {
   public InvalidCreditCardException(String message) {
      super(message);
   }
}

public class Main {

   public static void validateCreditCard(String cardNumber) throws
InvalidCreditCardException {
      if (cardNumber.length() != 16) {
         throw new InvalidCreditCardException("Error: Invalid credit card number
length.");
      }

      for (char ch : cardNumber.toCharArray()) {
         if (!Character.isDigit(ch)) {
            throw new InvalidCreditCardException("Error: Invalid credit card number
format.");
         }
      }

      System.out.println("Payment information updated successfully!");
   }
```

```
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String cardNumber = scanner.nextLine();

        try {
            validateCreditCard(cardNumber);
        } catch (InvalidCreditCardException e) {
            System.out.println(e.getMessage());
        }

        scanner.close();
    }
}
```
