## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 3\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

#### Section 1 : Coding

##### 1. Problem Statement

Alex is a treasure hunter who collects valuable items during their quests. Each item has a specific point value, and Alex wants to maximize their score by strategically removing items one at a time.

The rule is simple: Alex removes the item with the highest point value in each step until no items are left, summing the values of the removed items to calculate the maximum score.

Help Alex to complete his task.

##### ***Input Format***

The first line of input consists of an integer N, representing the size of the array.

The second line of input consists of N space-separated integers, representing the point values of the items.

### **Output Format**

The output prints "Maximum Sum: " followed by the calculated maximum score after removing all items.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 14

7 14 21 28 35 42 49 56 63 70 77 84 91 98

Output: Maximum Sum: 735

### **Answer**

```
import java.util.*;

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int N = scanner.nextInt();
        PriorityQueue<Integer> maxHeap = new
        PriorityQueue<>(Collections.reverseOrder());
        for (int i = 0; i < N; i++) {
            maxHeap.add(scanner.nextInt());
        }
        int maxSum = 0;
        while (!maxHeap.isEmpty()) {
            maxSum += maxHeap.poll();
        }
        System.out.println("Maximum Sum: " + maxSum);
    }
}
```

**Status :** Correct

**Marks :** 10/10

2. Problem Statement:

Imagine you have an array of integer values, and you're tasked with identifying a pair of elements within the array. This pair of elements should have a sum that is the closest to zero when compared to any other pair in the array.

Your goal is to create a program that solves this problem efficiently. The program should accept an array of integers and return the pair of elements whose sum is closest to zero.

### ***Input Format***

The first line of the input is an integer N representing the size of the array.

The second line of the input contains N space-separated integer values.

### ***Output Format***

The output is displayed in the following format:

"Pair with the sum closest to zero: {value} and {value}"

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5

9 10 -3 -5 -2

Output: Pair with the sum closest to zero: 9 and -5

### ***Answer***

```
import java.util.*;

class Main{
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int N = scanner.nextInt();
        int[] arr = new int[N];
        for (int i = 0; i < N; i++) {
            arr[i] = scanner.nextInt();
        }
    }
}
```

```

int minSum = Integer.MAX_VALUE;
int num1 = 0, num2 = 0;

for (int i = 0; i < N - 1; i++) {
    for (int j = i + 1; j < N; j++) {
        int sum = arr[i] + arr[j];
        if (Math.abs(sum) < Math.abs(minSum)) {
            minSum = sum;
            num1 = arr[i];
            num2 = arr[j];
        }
    }
}

System.out.println("Pair with the sum closest to zero: " + num1 + " and " +
num2);
}
}

```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement:

Mason is participating in a coding challenge where he must manipulate an integer array. His task is to replace every element in the array with the next greatest element to its right. The last element of the array remains unchanged, as there is no element to its right.

Your job is to help Mason write a program that performs this transformation and outputs the modified array.

#### **Input Format**

The first line of input contains an integer  $n$  representing the number of elements in the array.

The second line of input contains  $n$  space-separated integers representing the elements of the array.

### **Output Format**

The output prints the modified array of n integers, where each element (except the last one) is replaced by the maximum element to its right, and the last element remains unchanged.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 6

12 3 91 15 12 14

Output: 91 91 15 14 14 14

### **Answer**

```
import java.util.*;

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int n = scanner.nextInt();
        int[] arr = new int[n];

        for (int i = 0; i < n; i++) {
            arr[i] = scanner.nextInt();
        }

        int maxFromRight = arr[n - 1];

        for (int i = n - 2; i >= 0; i--) {
            int temp = arr[i];
            arr[i] = maxFromRight;
            if (temp > maxFromRight) {
                maxFromRight = temp;
            }
        }

        for (int i = 0; i < n; i++) {
            System.out.print(arr[i] + " ");
        }
    }
}
```

**Status : Correct**

**Marks : 10/10**

#### 4. Problem Statement

Emma is a data analyst working with a grid-based system where each cell contains important numerical data. The grid represents spatial data, inventory records, or structured reports that require periodic updates.

Due to system updates and new requirements, Emma needs to modify the grid in the following ways:

She wants to insert either a new row or a new column at a given position. Later, she needs to delete either a row or a column from the modified matrix.

##### ***Input Format***

The first line contains two integers rows and cols (the dimensions of the matrix).

The next rows lines contain cols space-separated integers representing the initial matrix.

The next line contains two integers insertType and insertIndex:

- insertType = 0 for row insertion, 1 for column insertion.
- insertIndex is the position where the new row/column should be added.

If inserting a row, the next cols integers represent the new row or If inserting a column, the next rows integers represent the new column.

The next line contains two integers deleteType and deleteIndex:

- deleteType = 0 for row deletion, 1 for column deletion.
- deleteIndex is the position to be deleted.

##### ***Output Format***

The first line of output prints the string "After insertion" followed by the modified matrix with the inserted row or column.

Each row of the matrix is printed on a new line with space-separated integers.

The next line prints the string "After deletion" followed by the final matrix after the specified deletion operation.

Each row of the resulting matrix is printed on a new line with space-separated integers.

Refer to the sample output for formatting specifications.

**Sample Test Case**

Input: 3 3

1 2 3

4 5 6

7 8 9

0 1

10 11 12

1 2

Output: After insertion

1 2 3

10 11 12

4 5 6

7 8 9

After deletion

1 2

10 11

4 5

7 8

**Answer**

```
import java.util.*;
```

```
class Main {  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
        int rows = sc.nextInt();  
        int cols = sc.nextInt();
```

```

int[][] matrix = new int[rows][cols];
for(int i = 0; i < rows; i++)
    for(int j = 0; j < cols; j++)
        matrix[i][j] = sc.nextInt();

int insertType = sc.nextInt();
int insertIndex = sc.nextInt();

if(insertType == 0) {
    int[] newRow = new int[cols];
    for(int i = 0; i < cols; i++)
        newRow[i] = sc.nextInt();

    matrix = insertRow(matrix, insertIndex, newRow);
} else {
    int[] newCol = new int[rows];
    for(int i = 0; i < rows; i++)
        newCol[i] = sc.nextInt();

    matrix = insertColumn(matrix, insertIndex, newCol);
}

System.out.println("After insertion");
printMatrix(matrix);

int deleteType = sc.nextInt();
int deleteIndex = sc.nextInt();

if(deleteType == 0) {
    matrix = deleteRow(matrix, deleteIndex);
} else {
    matrix = deleteColumn(matrix, deleteIndex);
}

System.out.println("After deletion");
printMatrix(matrix);
}

static int[][] insertRow(int[][] matrix, int index, int[] newRow) {
    int rows = matrix.length;
    int cols = matrix[0].length;
